                                                                                                                                                                                                                                                                                                                                                                                                                                                                      were subjected to thermolysis digested were sequenced.

The sequence R75536 was selected as a template for the corresp. AGP gene. An antisense RNA probe was synthesised for the pear cell suspension culture. Three cDNA clones were isolated for the pear cell suspension culture. Three cDNA clones were isolated for the pear cell suspension culture. Three cDNA clones were isolated for the sequenced. The sequence R75536 was selected as a template for the isolation or the corresp. AGP gene. An antisense RNA probe was synthesised from the PCR template and used to screen a cDNA library prepd.

The sequenced. The sequence of the longest cDNA clones were isolated and sequenced. The sequence of the longest cDNA clone PCAGP9 is shown in COSTAPTS(II).
                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

This is the nucleotide sequence of cDNA clone bk200_13, which includes an open reading frame for a 92-amino acid polypeptide (see W95346). The clone was isolated from a human adult retina CDNA library using methods which are selective for cDNAs encoding secreted proteins, or was identified as encoding a secreted or transmembrane protein on the basis of computer analysis of the amino acid sequence of the encoding protein. Database searches invention provides cDNA clones (see V9971-33) from human adult thyroid, adult retina, adult testis, foetal kidney and foetal brain that encode novel secreted proteins (see W9534-53). Each clone is thyroid, adult retina, adult testis, foetal kidney and foetal brain that encode novel secreted proteins (see W9534-53). Each clone is individually available from deposit clone ATCC 98451 (see also v9973-43). The isolated polynucleotides (PNS) and proteins are predicted to have activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting decises suggested activities include nutritional, cytokine, cell proliferation or differentiation, immune stimulating (e.g. as vaccines) or immune cutivantities include nutritional, cytokine, cell proliferation or differentiation, immune stimulating (e.g. as vaccines) or immune activiticis invasion suppressor, and tumour inhibition activities. The PNS are also a stated to he was full for the property.

New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders a claim 1; Page 256; 464pp; English.

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion of e.g. X737302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 123 novel genes and their fragments (nucleic acid sequences: X27311-X27449; amino acid sequences Y02650-Y02788) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 123 polynucleotides, based on which tissues they are most highly expressed in (see X27311 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                  Y, Moore PA,

DNA encoding polypeptide(s) eliciting programmed mammalian cell death - useful to detect programmed cell death in various cells, and to treat and diagnose human diseases, e.g. cancer.

Claim 1: Column 19-22; 23pp; English.

T35704 and T35705 represent the coding sequences for two proteins which elicit programmed mammalian cell death (PWCD). This encodes a PWCD protein designated RP-8. These sequences can be used in the treatment and diagnosis of human diseases, such as cancer, and to selectively eliminate immune cells linked to autoimmune diseases. These genes can also be used to monitor the extent of cell death associated with specific diseases, thereby allowing a course of treatment to be decided. A selective cancer therapy that works by selective activation of the body's own RP-8 and RP-2 genes will lessen, or eliminate the need for
                                                                                                                                                                                                                                                                                                                                                                  07-071-1996 (first entry)

The products can be used for detecting PCD, for activating PCD in unwanted cells such as cancer cells and immune cells linked to autoimmune diseases or for preventing unwanted cell death in degenerative discorders such as Alzheimer's disease, Parkinson's disease and Huntingdon's disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. neurological disorders, unseful for diagnosis and treatment of e.g. neurological disorders, tunnus Alsorders, inflammation or haematological disorders tunnus, immune Alsorders, inflammation or haematological disorders and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the presence of mutations in the new polynelectides. Specific uses are presence of mutations in the new polynuclectides. Specific uses are described for each polynuclectide, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, immune disorders, inflammatory disorders, skin disorders, tumours, atheroscierosis, restenosis, autoimmune disorders, neurological disorders, atheritic disorders, asthma, immunodeficiency disease, Albs and transplant refection. The polypeptides are also useful for identifying their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Muman secreted protein cDNA fragment containing gene 20.

New isolated human genes and the secreted polypeptides they encode Taim la; Page 238-239; 368pp; English.

Claim la; Page 238-239; 368pp; English.

This invention describes novel isolated human genes and the secreted proteins they encode. The products of the invention are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides.

Comparing the presence of mutations in the new polynucleotides.

Comparing the presence of mutations in the new polynucleotides.

Comparing the presence of mutations in the new polynucleotides.

Comparing the presence of mutations in the new polynucleotides.

Comparing the presence of mutations in the new polynucleotides.

Comparing the presence of mutations in the new polynucleotides.

Comparing the presence of mutations in the new polynucleotides.

Control of the presence of mutations in the new olynucleotides.

Control of the presence of mutations in the new olynucleotides.

Control of the presence of mutations of the lumine system.

Comparing the presence of mutation are cardiac muscle disorders, pulmonary disorders, inflections and AIDS. The human secreted proteins of the invention are concreted in X07852-Y07993 and the encoding nucleic acids are concreted and processed and presented in X07852-Y07993 and the encoding nucleic acids are concreted processed the processed and presented in X07852-X07993 and the encoding nucleic acids are concreted processed the processed and presented in X07852-X07993 and the encoding nucleic acids are concreted processed the processed and presented in X07852-X07993 and the encoding nucleic acids are concreted processed the processed and presented in X07852-X07993 and X0767.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human chemokine ZSIG-35 - used for, e.g. treating inflammatory disease, lymphocyte migration and ischaemia/reperfusion injury claim 15; Page 80-81; 105pp; English.

This nucleotide sequence includes an open reading frame for a novel human chemokine (see W30565), designated ZSIG-35, that has homology to members of the beta-chemokine family in particular to murine macrophage inflammatory protein. ZSIG-35 polynucleotides were initially identified by querying an expressed sequence tag database. The gene was mapped to chromosone 19p13.3. The invention provides ZSIG-35 polynucleotides and polypeptides, an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           V45444;
02-FEB-1999 (first entry)
Human chemokine ZSIG-35 cDNA.
ZSIG-35; beta-chemokine; human; ligand; lymphocyte migration;
inflammation; ischaemia; reperfusion injury; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1,2%; Score 36; DB 1; Length 1008; 100.0%; Pred. New isolated human genes and the secreted polypeptides they encode they classes. Inflammation or blood disorders, neurological disorders, inflammation or blood disorders.

Tabolds to X30173 represent 129 isolated human secreted protein genes.

Y04293 to Y04231 represent the secreted proteins encoded by the 29 human genes. The genes and their corresponding secreted protein or genes.

Y04293 to Y04231 represent the secreted proteins encoded by the 29 human genes. The genes and their corresponding secreted protein or genes are described for each of the new polypeptides are disposed by determining the presence of mutations in the new genes. Specific or by determining the presence of mutations in the new genes. Specific or by determining the presence of mutations in the new genes. Specific or by determining the presence of mutations in the new genes. Specific or set most highly expressed in, and include developing products for the disposis or treatment of cancer, tumours, developmental abnormalities and fiderial deficiencies, blood disorders, diseases of the immune system, disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney in the exemple of the includent of disorders, diseases are described for and forceders, diseases of the immune system, disorders, dispetitive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners.

The sequences given in X30174 to X30182 to Y04324 are used in the exemple of the immune sequences.
                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human secreted protein gene 6.

The clone was produced by subcloning a style-stigma specific cDNA, 3C9, obtd. from Prof. Goldberg of UCLA, into pGEM1, to produce pMG3C9. The clone was found to be stigma-style specific in Northern analysis. A probe from the clone was used to isolate the corresp, genomic sequence which is specifically expressed in style stigma tissues of the female organ of tobacco. The corresp, clone pSTG3C9, contains STMG3C9, an "STMG-type" gene. This and other similar genes can be used to produce new hybrid plants or seeds having a combination of desirable traits, and showing hybrid vigour. A female-sterile, male-fertile plant can be produced which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified plant with transformed nuclear genome - obtd. by using foreign DNA encoding prod. which disrupts metabolism, functioning and/or development of plant.
                                                                                                                                                                                                                                                                             12-APR-1991 (first entry)
Plasmid pWG3C9 used to isolate style-stigma specific gene STG3C9.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ŏ
   New isolated human genes and the secreted polypeptides they encode
Claim la; Page 235-236; 368pp; English.

Entre therapy encode. The products of the invention are useful for proteins they encode. The products of the invention are useful for considerable therapy. Also pathological conditions, e.g. by protein considerable therapy. Also pathological conditions, e.g. by protein considerable therapy. Also pathological conditions can be diagnosed by determining the presence of mutations in the new polynucleotides by determining the presence of mutations in the new polynucleotides.

CC Specific uses are described for each of the 101 polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, altergies, Alzheimer's and cognitive disorders, schizophrenia, prostate disease, skeletal or cardiac muscle disorders, pulmonary disorders, casteoporosis, arthritis or malignancies, digestive/endocrine disorders, infections and AIDS. The human screted proteins of the invention are represented in Y07852-Y07993 and the encoding nucleic acids are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; secreted protein; treatment; prevention; protein therapy; AIDS; gene therapy; diagnosis; cancer; tumour; neurodegenerative disorder; gene therapy; diagnosis; cancer; tumour; neurodegenerative disorder; leukemia; immune system disease; hepatic disease; lymphoma; renal disease; inflammation; allergy; Alzheimer's disease; schizophrenia; cognitive disorder; prostate disease; skeletal; cardiac; muscle disorder; pulmonary disorder; transplant rejection; osteoclast; osteoporosis; arthritis; malignancy; digestive; endocrine; infection; ss.

New isolated human genes and the secreted polypeptides they encode Claim la: Page 232-233; 886pp; English.

This invention describes novel isolated human genes and the secreted proteins they encode. The products of the invention are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 101 polynucleotides. Based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, Alzheimer's and cognitive disorders, schizophrenia, prostate disease, skeletal or cardiac muscle disorders, pulmonary disorders, transplant rejection, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, digestive/endocrine disorders, infections and AIDS. The human secreted proteins of the invention are represented in Y07852 Y07993 and the encoding nucleic acids are sequence 1089 BP; 367 A; 202 C; 240 G; 279 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

/note="vector: p773D-Pac (Pharmacia) with a Ur-R-Al
library. The UI-R-Al library consisted of a mixture of
individually tagged normalized libraries constructed from
rat placenta, adult lung, brain, liver, kidney, heart,
spleen, ovary, and muscle. The tag is a string of 3-5
nucleotides present between the Not I site and the
oligo-dT track which allows identification of the library
of origin of a clone within the mixture. The subtracted
library (UI-R-Al) was constructed as follows: PCR
amplified cDNA inserts from a pool of approximately 3.840
UI-R-AO clones from which 3' ESTS had been derived was
used as a driver in a hybridization with the UI-R-AO
library in the form of single-stranded circles. The

Tissue isolation and library construction performed at the National
Institute of Diabetes and Digestive and Kidney Diseases, NIH (see
http://www.niddk.nth.gov/intram/people/boliver.htm). DNA sequencing
and analyses performed by National Institutes of Health Intramural
Sequencing Center (NISC; see http://www.nisc.nth.gov). Chromatogram
data were analyzed and evaluated for high quality using the ted
program (Gleeson T and Hillier L, 1991).

                 /note="Organ: testis: Vector: pBlueScript SK (Stratagene);
Site_1: EcoR I; Site_2: Xho I; Testes dissected from 1-5
day adult y[*] w(67c1)/Y males raised at 25cc. RNA
isolated using Trizol (Life Technologies) and a single
round of Poly(A)* selection using Oligotex (Olagen). cDNA
library constructed using Stratagene ZAP-cDNA syntesis
kit. Oligo dT-primed, size fractionated -1-6 kb, and
directionally cloned at EcoRI and XhoI in Uni-ZAP XR.
Following a single round of amplification pBlueScript SK
phagemids were mass excised. A distribution channel for
clones is being sought, but not currently available.
Requests for clones cannot be honored."

/note="Organ: blood; Vector: pCRII; Site_1: EcoRI; Site_2: EcoRI; Human peripheral blood mononclear cells were cultured in the presence or absence of erythropoietin.
CULT++++ cells arising only in erythropoietin-supplemented medium were isolated by fluorescence activated cell sorting. Those cells demonstrated an average of six additional doublings in suspension culture and erythroid colony formation in methylcellulose. Suppression subtractive hybridization was used to construct the ad library (tester-sorted CD71+++ cells, driver-unsorted cells cultured without erythropoietin)."

/lab_host="bhlob"
/note="Organ: liver; Vector: pWE18S-FL3; Site_1: DraIII
(ACCTGTGTG); Site_2: DraIII (CACCATGTC); 1st strand cDNA
was primed with an oligo(dT) primer
(ATGTGGCTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCTACTGG], digested
and cloned into distinct DraIII sites of the pWE18S-FL3
vector (5' site CACTGTG, 3' site CACCATGTG). Xhol should
be used to isolate the CDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGAAAGCTGCG and 3' end
primer_CGACCTGGAGCTGGAGA."

/tlssue_type="immature flowers of field grown plants. The cDNA library was prepared using the Strategene PBluescript II
Xhof; This cDNA library was constructed from mRNA isolated from immature flowers of field grown plants. The cDNA library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly (dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into XLO-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John

```

```
Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. Library went through one round of normalization to Cot5, and was constructed by Bento Soares and M. Fatima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /lab_host="DH10B"

STN INTERNATIONAL LOGOFF AT 14:36:22 ON 23 SEP 2000 DISCOUNT AMOUNTS (FOR QUALIFYING ACCOUNTS) SINCE FILE TOTAL ENTRY ENTRY FULL ESTIMATED COST CA SUBSCRIBER PRICE COST IN U.S. DOLLARS Executing the logoff script. --Logging off of STN--=> LOG Y Ξ î î channel (P-Na:P-K = 1.1 +- 0.1). The channel is calcium permeable identical to that originally cloned from rat colon. The alpha-rENaC channel in a mammalian cell system and provide evidence that the ENaC/degenerin family of proteins are capable of mediating both transceptibelial sodium transport and are involved in signal is applied to cell attached patches, cell swelling, or patch excision. Sequence analysis indicated that the osteoblast clone's sequence (P-Na:P-Cl mchgt 20). The channel is only active after negative FILE STNGUIDE ENTERED AT 14:21:35 ON 23 SEP 2000 FILE 'MEDLINE, EMBASE, BIOSIS, INPADOC, CAPLUS' ENTERED AT 14:28:05 ON 23 of alpha-rENaC resulted in the expression of a 24.2 +- 1.0 psec These results represent the first heterologous expression of an FILE MEDLINE ENTERED AT 14:19:58 ON 23 SEP 2000 216 S EPITHELIAL SODIUM CHANNEL/AB,BI 28596 S TRANSGEN?/AB,BI 5 S L1 AND L2 LM(TK-) cells, a null cell for SA-CAT activity. Stable transfectants expressed (P-Na:P-Ca = 1.4 +- 0.1) and highly selective for cations over (FILE HOME' ENTERED AT 14:19:52 ON 23 SEP 2000) the expected 74-kDa protein corresponding to alpha-rENaC. 10 DUP REM L4 (13 DUPLICATES REMOVED) was cloned into an expression plasmid and transfected into obtained of the entire coding region of rat alpha-ENaC by mechano-sensitive cells such as osteoblasts. 1 S L4 AND OSTEOBLAST#/AB,BI 1 S L4 AND OSTEOCALCIN/AB,BI E HRUSKA KEITH/AU 5 S L8 AND L1 175 S E3-E6 23 S L3 (alpha-rENaC).
